Senior Data Engineer | Databricks | PySpark | SQL | Snowflake | AWS | Immediate Joiner

SUMMARY

Senior Data Engineer with 8+ years of experience designing, building and running production data pipelines on Databricks, Apache Spark (PySpark), SQL, Delta Lake and Snowflake, most recently for Nike's North America retail analytics on AWS. Built Canada inventory and purchase-order pipelines, hardened a new search clickstream data product, and migrated Airflow orchestration to Databricks Workflows across 10 data products. Saved ~$22K/year in Databricks compute. Databricks and Snowflake certified. Available to join immediately.

SKILLS AND CERTIFICATIONS

- **Data Platforms:** Databricks (Workflows, Delta Lake, Unity Catalog, Auto Loader, Databricks SQL), Apache Spark, PySpark, Spark SQL, Snowflake, AWS, Azure Data Lake Storage (ADLS)
- **Languages:** SQL, Python, JavaScript
- **Data Engineering:** ETL and ELT pipelines, data lakehouse, data modelling, data quality (spark-expectations), historical backfills, Spark performance tuning, cluster cost optimisation
- **Orchestration, CI/CD and Streaming:** Databricks Workflows (Brickflow), Apache Airflow, Jenkins, GitHub, Git, Poetry, pytest, Apache Kafka, Apache NiFi
- **Observability, Reliability and Tools:** Pipeline observability and alerting (Slack, PagerDuty), production reliability and incident engineering, AI-augmented engineering, REST APIs, RBAC, MarkLogic, Power BI integration, Agile (JIRA, Rally)
- **Certifications:** Snowflake SnowPro Core (Sept 2025), Databricks Certified Data Engineer Associate (July 2025), Microsoft Azure AZ-900 (July 2025), Neo4j Certified Professional (July 2025), MarkLogic Certified Developer (Sept 2023)

WORK EXPERIENCE

Knowledgeforce, Pune (client: Nike ITC, Bengaluru) ***March 2026 - October 2026***

Role: Senior Data Engineer

North America retail analytics (inventory, store sales, orders, demand, planning), consumer digital, search clickstream and marketing CRM data products on Databricks (AWS), PySpark, SQL, Delta Lake, Unity Catalog and Snowflake.

- **Inventory and Purchase-Order Pipelines (Canada Expansion):** Built daily incremental and idempotent 2-year backfill pipelines in PySpark and SQL across Databricks and Snowflake to onboard Canada inventory and purchase-order data into North America analytics. Isolated US and Canada write paths to ensure zero regression on existing US reporting, and resolved a product-master join fan-out that had doubled inventory availability figures.
- **Data Quality Automation (Spark Expectations):** Implemented automated row-level, aggregate, and query-based data quality checks using spark-expectations across R360 gold tables (inventory, store, and planning). Added strict validation rules for the Canada market expansion covering reserved-on-hand and general availability presence, non-negative quantities, and duplicate grain checks to guarantee downstream reporting accuracy.
- **Search Clickstream Data Product:** Validated and hardened a new search analytics product that stitches consumer clickstream events: tested the MVP columns end to end against source data, fixed purchase and click-position logic, raised defects on purchase metrics and locale derivation, and documented the design and findings.
- **Cloud FinOps (~$22K/yr Saved):** Cut Databricks compute cost by ~$22K/year across the most expensive workflows of 4 teams, using Databricks Job Advisor recommendations and the cost dashboard: moved memory-optimised nodes to AWS Graviton general-purpose instances, lowered autoscale minimums (17 to 1 and 10 to 1 workers) and split heavy session aggregators into dedicated cluster configs.
- **Airflow-to-Databricks Migration:** Migrated inventory, store sales and planning pipelines (including an aggregate feeding a leadership report) from Apache Airflow to Databricks Workflows (Brickflow), with cross-system dependency sensors validated over 3 consecutive production runs, then decommissioned 15+ legacy DAGs across 10 data products.
- **View DDL CI/CD Automation:** Automated the production deployment of 29 North America and APLA analytics views, replacing manual notebook releases with a Git-driven CI/CD pipeline.

- **AI-Ready Observability and Alerting:** Built a shared failure-alerting framework (task decorator plus an uncaught-failure handler at each workflow entry point) that sends structured error details to Slack so an internal LLM operations agent can read failures and suggest fixes; grew alert coverage from 1 to 7 production data products and surfaced previously silent library and startup failures.
- **Platform Modernisation and Spark Resilience:** Upgraded ~30 production workflows to Databricks Runtime 16.4 and standardised data-quality (spark-expectations) and dependency configurations across 10 data products in a single coordinated release. Hardened heavy PySpark aggregations against Spot instance and shuffle failures using staging materialisation, checkpointing, and hybrid On-Demand/Spot cluster strategies, while fixing upstream sensor execution-date logic to prevent partial data loads.
- **Business-Critical Data Integrity:** Fixed a UTC-to-Pacific conversion that mis-dated digital sales for all North America users by deriving the transaction date by marketplace type, and moved the orders load behind a wait-for-upstream gate so Power BI reports receive fresh data.
- **Marketing CRM and Production Operations:** Ran an 8-month email and push backfill for marketing CRM, covered production support rotations across 4 teams, and used AI coding agents with strict pytest and spark-expectations guardrails to ship coordinated multi-pipeline releases.

ValueMomentum Software Services Pvt. Ltd., Bengaluru ***May 2024 - January 2026***

Role: Senior Software Engineer | Data Engineer | Offshore Lead

Insurance client: policy and claims platform on Databricks, Snowflake, Azure Data Lake and MarkLogic.

- Built ingestion and transformation pipelines in Databricks using PySpark, Delta Lake and Auto Loader, with SQL-based data quality workflows and monitoring notebooks.
- Built Snowflake pipelines from Azure Data Lake, designed semantic models and reusable views for BI reporting, and benchmarked migrating Databricks SQL workloads to Snowflake.
- Led the offshore development and support team and acted as Product Owner, reducing the development backlog by 30% through Rally-driven sprints.
- Owned production incident triage with overnight turnaround on high-priority issues and reduced recurring reporting failures.

Datavid Private Limited, Remote ***February 2022 - May 2024***

Role: Consultant

- Streamlined data processing for 300K+ healthcare members using Apache NiFi pipelines integrated with MarkLogic, improving query response time by 40%.
- Built search and export APIs with role-based access control (RBAC) and audit logging; improved API throughput through index tuning and caching.
- Translated business requirements into API specifications with cross-functional teams, and authored Swagger documentation and unit tests to keep APIs reliable across releases.

Tata Consultancy Services, Chennai ***July 2018 - February 2022***

Role: Systems Engineer

- Built MarkLogic and JavaScript backends and REST APIs for financial portfolio data, improving processing efficiency by 20% and data interoperability by 30%.
- Designed data ingestion and transformation flows that kept multi-source structured and unstructured financial datasets accurate and consistent.
- Automated data validation and reconciliation with UNIX scripts, reducing manual effort by 25%; served as Information Security point of contact for audits and BCP/DR readiness.

EDUCATION

B.Tech, Vellore Institute of Technology (VIT), Vellore (CGPA: 7.34) ***2014 - 2018***
